

ABSTRACT OF THE DISCLOSURE

In a digital protection relay with a time sync function, the sampling timing of which is specified based on a reference timing transmitted from a time
5 signal generator to time sync means, with a determination value, the time sync means includes a reception circuit that receives a discrimination code and time data transmitted from the time signal generator, a code
discrimination circuit that discriminates the reference
10 timing on condition that the received discrimination code coincides with a desired code, a time calculation circuit that calculates the sampling timing on the basis of the discriminated reference timing and the time data, and a sampling sync circuit that specifies
15 the sampling timing of a digital quantity of electricity on the basis of the calculated sampling timing.
